Astrophysics QP1

| 1 | When nearby stars are observed over a period of a year, their positions are seen to move in tiny ellipses relative to the background of more distant stars. | |
|---|---|-----|
| | (a) Explain why relative movement of these nearby stars is observed. | (3) |
| | (b) By means of a labelled diagram, outline the steps necessary for this effect to be used | |
| | to find the distance to nearby stars. | (3) |
| | | |
| | | |
| | | |
| | (c) The effect is too small for the distances to more distant stars to be determined. Outline a method which can be used for more distant stars. | |

4 A Cepheid variable star contracts and expands repeatedly and as it does, so its

| energy involved. Although the coals are hot, the total amount of thermal energy transferred to the soles of the walker's feet is small. This is a little like quench hot metal bar in a trough of cold water. The metal bar cools rapidly, transferring energy to the water, but the rise in temperature of the water is quite small becauterelatively large value for the specific heat capacity of the water. (a) Describe an experiment you could carry out to measure the specific heat capacity as a known temperature in a Bunsen flame and plunged into a container of wat the measurements that you would need to make and give the theoretical bas calculation that you would carry out. What assumption would you make in calculating the specific heat capacity of metal? (b) Coals used for firewalking typically glow a dull red, with the peak energy etaking place at a wavelength of about 2 μm. | 5 | Records of people walking on fire have existed for thousands of years. Walking across hot coals without getting burned does seem impossible, especially when the coals are at a temperature of 1500 K. However, as long as they do not take too long to walk across the coals, firewalkers won't get burned. | |
|---|---|---|-----|
| a metal, assuming that you have a number of metal washers which can be he a known temperature in a Bunsen flame and plunged into a container of wat the measurements that you would need to make and give the theoretical bas calculation that you would carry out. What assumption would you make in calculating the specific heat capacity of metal? (b) Coals used for firewalking typically glow a dull red, with the peak energy etaking place at a wavelength of about 2 μm. | | The explanation may have something to do with the relatively small amount of thermal energy involved. Although the coals are hot, the total amount of thermal energy transferred to the soles of the walker's feet is small. This is a little like quenching a red hot metal bar in a trough of cold water. The metal bar cools rapidly, transferring thermal energy to the water, but the rise in temperature of the water is quite small because of the relatively large value for the specific heat capacity of the water. | 1 |

7 Current theory predicts that there is a massive black hole at the centre of every galaxy. It is suggested that if galaxies approach, then their central black holes begin to orbit each other until the galaxies merge.

In 2009, astronomers found convincing evidence of two such black holes orbiting as a binary system. From data collected, they estimated that the separation of the black holes was 3.2×10^{15} m and that their masses were 1.6×10^{39} kg and 4.0×10^{37} kg.

| (a) (1) | State the origin of the force that maintains the black holes in an orbit. | |

| | Distance from the Earth = | |

Stars exist by fusing hydrogen within their cores. This process generates heat which pushes the star outwards. This outward pressure is matched by the gravitational forces pulling the star inwards. This maintains an equilibrium, allowing the star to radiate away vast amounts of energy for long periods of time. Our Sun has been in this state for about 4.5 billion years.

Eventually the star runs out of hydrogen to fuse, and so changes occur which allow fusion of helium to form heavier elements. Massive stars can produce elements up to iron in their cores by fusion.

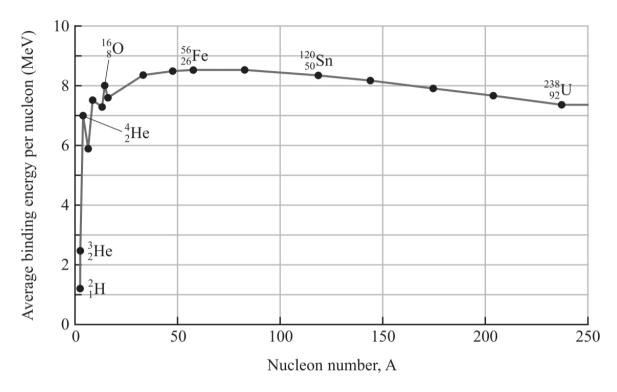

Once a star's core has been converted into iron no further fusion can take place and the rapid collapse of the star results in a supernova explosion.

The remnant of the supernova may be a neutron star or black hole, depending upon the remnant's mass.

| . , | star. | |
|-----|---|-----|
| | State and explain: | |
| | how the process of fusion is able to release energy | |
| | • the conditions necessary for fusion to occur | |
| | • why the conditions are difficult to replicate outside of a star. | |
